AMENDMENTS TO THE CLAIMS:

This listing of claims is the current listing of claims. No amendments have been made

 (previously presented) A dose of multilayer synthetic resin for the realization of multilayer objects by compression molding,

said dose having an axis of symmetry and, before any compression molding, comprising a first synthetic resin and at least one thin functional layer of a different synthetic resin forming the outer shell of a body of revolution defined about said axis of symmetry, said body of revolution comprising two ends disposed in a direction parallel to the axis of symmetry, said functional layer being totally imprisoned in said first synthetic resin, and wherein the ends are at a distance of at least 50 microns from the surface of the dose

- (previously presented) The dose as claimed in claim 1, wherein the thin functional layer itself forms a multilayer structure comprising a layer of barrier resin imprisoned between two layers of adhesive resin.
- (previously presented) The dose as claimed in claim 1, wherein both ends of the functional layer are open.
- (previously presented) The dose as claimed in claim 1, wherein one of the two ends of the functional layer is open and the other end is closed.
- 5. (previously presented) The dose as claimed in claim 1, wherein both ends of the functional layer are closed.
- 6. (previously presented) A multilayer object obtained by compression molding from a dose as claimed in claim 1, said object containing an inner face and an outer face, said inner face defining the inner part of a packaging, said object being formed of said first synthetic resin and said thin functional layer, said functional layer being imprisoned in the wall of said object and forming a fold, said object being wherein the functional layer is totally absent from said inner face.

- 7. (previously presented) A production method for doses such as defined in claim 1, comprising a step according to which the resins are coextruded so as to form a multilayer flow, said flow being periodically cut so as to form individual portions, said portions being transferred into a compression mold, wherein said portions are deformed in such a way as to cover over the ends of the functional layer with the first synthetic resin.
- 8. (previously presented) The method as claimed in claim 7, wherein said portions are deformed during the cutting.
- (previously presented) The method as claimed in claim 7, wherein said portions are deformed during their transfer into the mold.
- 10. (previously presented) The method as claimed in claim 7, wherein said portions are deformed once they are in the mold.
- 11. (previously presented) A method for producing doses such as defined in claim 1, comprising a step in which the resins are coextruded in one and the same direction, wherein the method comprises, in succession, a covering step in which solely said first resin is extruded, a coextrusion step, and a further covering step so as to totally imprison said functional layer.
